# PRE RE-ROUTE AGENT EXECUTION

Evolus AI Agent Implementation Brief + Spatial Intelligence Extension

Poultry Shipments: Santos (Brazil) → Jebel Ali (UAE)

| | |
|---|---|
| **Document** | Pre Re-route Agent Execution v1.1 (24-Hour Build) |
| **Platform** | Evolus AI + World Labs (Marble / World API) |
| **Email System** | Gmail / Google Workspace |
| **Preferred Model** | Gemma (Google) with multi-model fallbacks |
| **Audience** | Trade Operations, Logistics, Finance, Compliance, IT |
| **Build Target** | Executable within next 24 hours |
| **Date** | 17 October 2026 |

This document defines the user story, end-to-end workflow, exact Digital Employee system prompt, workbook specification, all technical parameters, and a prioritised Spatial Intelligence Extension using World Labs. World Labs implementations are ordered from easiest to hardest so the team can deliver a working core agent plus first spatial capability inside 24 hours.

# 1. USER STORY

**As a** Trade Operations professional responsible for active refrigerated poultry shipments from Santos, Brazil to Jebel Ali, UAE,
**I want** an AI agent that continuously monitors our organisational Gmail for shipping updates and regional disruption signals (Gulf / Hormuz / Red Sea conflicts), automatically evaluates re-route risk, produces a curated workbook of highly qualified alternative service providers for Jeddah and Salalah, and optionally supplies a spatial (3D) briefing of the recommended port,
**so that** when a formal diversion is issued by the shipping line we can immediately engage pre-registered providers, minimise cold-chain risk, forecast incremental cost for Finance, and keep Compliance informed — without manual inbox scanning or last-minute provider search.

## Acceptance Criteria

- Agent monitors designated Gmail mailbox / labels for active Santos–Jebel Ali poultry shipments.
- Detects disruption signals (Hormuz restrictions, Red Sea/Gulf incidents, carrier diversions, port congestion, ETA slips).
- Recommends primary alternative port (Jeddah or Salalah) with justification.
- Generates / attaches a two-tab workbook (Jeddah | Salalah) containing only providers with highly qualified Google reviews.
- Shares risk summary + workbook with Trade Operations for approval.
- Upon approval, drafts outreach to selected providers requesting pre-registration and required documents.
- Produces a cost forecast range for the re-route and notifies Finance and Compliance.
- All outbound emails / messages require explicit human approval before sending (Evolus default safeguard).
- Optional: attaches or links a World Labs spatial preview of the recommended port for visual decision support.
- Full audit trail of every step is retained in Evolus activity log and Digital Employee memory.

# 2. SCOPE & SHARED PARAMETERS

| Parameter | Value / Rule |
|---|---|
| Origin – Destination | Santos (Brazil) → Jebel Ali (UAE) |
| Commodity | Refrigerated poultry (cold-chain critical) |
| Primary risk context | Regional conflict in Gulf; Hormuz restrictions; Red Sea disruptions. Salalah & Jeddah are established alternatives. |
| Email system | Gmail / Google Workspace (OAuth or IMAP) |
| Preferred LLM | Gemma (Google); fallbacks: Gemini → Claude → GPT |
| Platform components | Evolus Digital Employee + Specialised Agent + Automations + World Labs (Marble / World API) |
| Workbook structure | Two tabs: (1) Jeddah Service Providers (2) Salalah Service Providers |
| Provider curation rule | Only providers with highly qualified Google reviews (high volume + recent positive mentions of refrigerated/food/customs performance) |
| Primary recipients | Trade Operations team (first) |
| Secondary recipients | Finance team (cost forecast); Compliance team (regulatory notes) |
| Post-approval action | Draft outreach to top providers for pre-registration + required documents list |
| Human-in-the-loop | Mandatory approval for every outbound email / message (cannot be disabled) |
| Spatial layer | World Labs Marble / World API for optional 3D port briefings (see Section 10) |
| Hardware note | AMD + ROCm relevant only for future local hosting; not required for Evolus or World Labs cloud APIs |

## 3. END-TO-END WORKFLOW

### Phase 1 — Continuous Monitoring

Digital Employee + scheduled / email-triggered Automation watches the designated Gmail mailbox and labels for messages related to active Santos–Jebel Ali poultry shipments (vessel names, B/L numbers, carrier updates, ETA changes, diversion notices).

### Phase 2 — Risk Assessment

On relevant email: extract shipment identifiers, vessel, current route/ETA, any delay or diversion language. Enrich with web search and known maritime advisories. Call the specialised Route-Risk agent to score disruption risk and recommend primary alternative port (Jeddah or Salalah) with secondary options.

### Phase 3 — Flag & Share Workbook (+ optional spatial briefing)

If risk exceeds threshold: generate or refresh the two-tab curated workbook. Optionally attach or link a pre-generated or on-demand World Labs 3D port world. Draft message to Trade Operations containing risk summary, recommended port, workbook, and spatial link. Hold for human approval, then send.

### Phase 4 — Pre-registration Outreach (on Trade Ops approval)

Draft individual outreach emails to the top 2–3 recommended providers requesting: (a) pre-registration of company/shipment details, (b) list of required documents for expedited clearance, (c) estimated timelines and any cold-chain handling notes. All drafts held for human approval before send. Track responses in Digital Employee memory and update workbook status.

### Phase 5 — Cost Forecast & Internal Notifications

Produce a cost forecast range (extra sea freight, trucking, demurrage, inspection, cold-chain differentials). Draft notifications to Finance (incremental cost impact) and Compliance (SFDA / Omani customs / free-zone / temperature-integrity notes). Hold for approval, then send.

| Step | Actor | Action | Output / Gate |
|---|---|---|---|
| 1 | Automation / DE | Monitor Gmail for shipment & disruption signals | Relevant emails flagged |
| 2 | Specialist Agent | Extract data + risk score + port recommendation | Risk assessment object |
| 3 | Automation | Generate / attach two-tab workbook | Workbook file |
| 3b | World Labs (opt.) | Attach or generate spatial port preview | 3D world link |
| 4 | DE + Human | Notify Trade Operations (approval required) | Approved or rejected |
| 5 | DE + Human | Outreach to providers for pre-reg + documents | Drafts approved & sent |
| 6 | Agent + DE | Cost forecast calculation | Cost range + assumptions |
| 7 | DE + Human | Notify Finance & Compliance | Approved notifications sent |
| 8 | DE | Update memory map & workbook status | Audit trail complete |

## 4. WORKBOOK SPECIFICATION

The agent maintains (or regenerates on demand) a single workbook with exactly two tabs. Providers are curated exclusively from highly qualified Google reviews (high review volume + recent positive mentions of refrigerated cargo, food products, poultry, customs speed, or port expertise). An optional Spatial Preview column can hold World Labs world links.

### Tab 1 — Jeddah Service Providers | Tab 2 — Salalah Service Providers

| Column | Description |
|---|---|
| Provider Name | Legal / trading name |
| Service Type | Customs Clearance / Cold-Chain Logistics / Bonded Storage / Full 3PL |
| Google Rating & # Reviews | Minimum threshold: highly qualified (e.g. ≥4.5 with meaningful volume) |
| Key Strengths | SFDA/Halal experience, reefer handling, port presence, free-zone capability |
| Contact / Website | Primary email, phone, web URL |
| Pre-registration Requirements | Documents or data the provider needs in advance |
| Est. Clearance Time | Typical working days under normal conditions |
| Notes / Preferred Status | Internal flag: Preferred / Pre-vetted / New / Do-not-use |
| Spatial Preview (optional) | World Labs Marble / Atlas share link for facility or port area |

## 5. DIGITAL EMPLOYEE — SYSTEM PROMPT & PROCEDURES

Copy the following text into the Digital Employee's instructions / procedures in the Evolus portal. Adjust distribution lists and exact mailbox labels to match your organisation.

### Exact System Prompt / Procedure Text

```
You are the Pre Re-route Digital Employee for refrigerated poultry shipments moving from Santos, Brazil to Jebel Ali, UAE.

IDENTITY & TOOLS
- You have your own organisational Gmail mailbox (or shared monitoring mailbox) connected via Google Workspace / IMAP.
- You maintain a memory map of active shipments, vessels, B/L numbers, ports, providers, and past decisions.
- You can call the specialised Route-Risk agent, perform web search, read documents, create files (workbook), and draft emails.
- Preferred reasoning model: Gemma (Google). Use available fallbacks if needed.
- Every outbound email or message MUST be shown to a human for explicit approval before sending. This rule cannot be overridden.
- Optional spatial layer: you may attach or link a pre-generated World Labs 3D port world (Jeddah or Salalah) when risk is Medium or higher.

CORE OBJECTIVE
Continuously monitor for sea-route disruption risk on active Santos–Jebel Ali poultry shipments. When risk is material, produce a curated two-tab workbook of alternative service providers (Jeddah and Salalah), share it with Trade Operations, and—after their approval—initiate pre-registration outreach and cost forecasting for Finance and Compliance. Where available, include a spatial (3D) briefing of the recommended port.

MONITORING RULES
- Watch the designated Gmail labels/folders for messages containing: vessel names, B/L numbers, "Santos", "Jebel Ali", carrier names, "delay", "diversion", "reroute", "Hormuz", "Salalah", "Jeddah", "Fujairah", "Khor Fakkan", port congestion, or security advisories.
- On every relevant new email: extract shipment ID, vessel, current ETA/route, and any explicit diversion language.
- Enrich with current public maritime status (Hormuz traffic, Red Sea/Gulf incidents, carrier notices) via web search when needed.

RISK ASSESSMENT
- Call the Route-Risk specialist agent with the extracted data.
- Consider cold-chain sensitivity: extra transit days increase spoilage and insurance risk for poultry.
- If risk is elevated, recommend primary alternative port (Jeddah or Salalah) and secondary options with brief justification.

WORKBOOK GENERATION
- Maintain or regenerate a workbook with exactly two tabs: "Jeddah Service Providers" and "Salalah Service Providers".
- Include only providers that meet the highly-qualified Google review standard (high volume + recent positive mentions of refrigerated, food, poultry, or customs performance).
- Columns: Provider Name | Service Type | Google Rating & # Reviews | Key Strengths | Contact / Website | Pre-registration Requirements | Est. Clearance Time | Notes / Preferred Status | Spatial Preview (optional).
- Prioritise any providers previously marked Preferred or Pre-vetted in memory.

SPATIAL BRIEFING (OPTIONAL)
- If a pre-generated World Labs world exists for the recommended port, include the share link in the Trade Operations notification and in the workbook Spatial Preview column.
- Label every spatial asset: "AI-generated spatial approximation — verify with provider / port authority."
- Do not block the core notification if spatial generation is unavailable or slow.

NOTIFICATION SEQUENCE (STRICT ORDER)
1. Trade Operations first: Send risk summary + recommended port + attached workbook (+ spatial link if available). Ask them to confirm whether to proceed with pre-registration outreach.
2. Only after Trade Operations approval: Draft outreach emails to the top 2–3 providers requesting (a) pre-registration of our company/shipment, (b) list of documents required for expedited clearance, (c) estimated timelines and cold-chain notes. Hold each draft for human approval.
3. Produce a cost forecast range (extra sea freight, inland trucking, demurrage, inspection, cold-chain differentials). Clearly label it as an estimate pending actual quotes.
4. Notify Finance with the cost forecast and key assumptions.
```

5. Notify Compliance with relevant regulatory notes (SFDA / Halal for Jeddah; Omani customs & free-zone rules for Salalah; temperature-integrity requirements).

ESCALATION & UNCERTAINTY

- If shipment data is incomplete or risk is ambiguous, ask Trade Operations for clarification before generating the workbook.
- Never invent provider contact details or review scores. If data is missing, mark the field and flag for human review.
- Record every decision, approval, and response in your memory map for auditability.

TONE & TRANSPARENCY

- Be concise, factual, and action-oriented.
- Always identify yourself as an AI Digital Employee in external communications as required by platform policy.
- Keep internal summaries short so humans can decide quickly.

## 6. SPECIALISED ROUTE-RISK AGENT — INSTRUCTIONS

Create a specialised agent in Evolus with the following role description and knowledge base. This agent is called by the Digital Employee / Automations.

```
You are a specialised logistics risk analyst for refrigerated poultry shipments from Santos, Brazil to Jebel Ali, UAE.
Your job is to assess sea-route disruption risk arising from regional conflict in the Gulf / Hormuz / Red Sea area and to recommend alternative ports and service-provider shortlists.

Known context: Salalah (Oman) and Jeddah (Saudi Arabia) are established alternative discharge ports when direct access to Jebel Ali is impaired. Fujairah and Khor Fakkan may also appear in contingency plans.

When given shipment data and any disruption signals:
1. Score the risk (Low / Medium / High / Critical) with a one-paragraph justification.
2. Recommend primary and secondary alternative ports.
3. Highlight cold-chain implications (extra days, temperature integrity, inspection risk).
4. Reference the curated provider workbook principles: only highly qualified Google-reviewed providers for customs clearance and logistical support.

Output structured, concise assessments that the Digital Employee can attach to Trade Operations notifications.
```

### Knowledge base to upload

- Current and historical carrier advisories for Santos–Middle East trades
- Port guides for Jebel Ali, Jeddah Islamic Port, Port of Salalah, Fujairah, Khor Fakkan
- SFDA / Halal / cold-chain requirements for poultry into Saudi Arabia
- Omani customs and Salalah Free Zone procedures for refrigerated cargo
- Master list of preferred / pre-vetted service providers (seed for the workbook)
- Internal SOPs for re-route decision authority and cost approval thresholds
- Pre-generated World Labs spatial world links for Jeddah and Salalah (if available)

## 7. AUTOMATION BLOCK OUTLINE (EVOLUS CANVAS)

| Block / Stage | Description |
|---|---|
| Trigger | Incoming email (Gmail) matching shipment / disruption keywords OR scheduled check (e.g. every 4–6 h) |
| Read & Extract | Process with AI / data extractor → shipment ID, vessel, ETA, diversion language, attachments |
| Enrich | Optional web search or API call for live port / Hormuz / carrier status |
| Assess | Ask specialised Route-Risk agent → risk score + port recommendation |
| Decision | Choice / Routing block: if risk ≥ Medium → continue; else archive / low-priority log |
| Workbook | Create file or refresh existing two-tab workbook from knowledge base + review rules |
| Spatial (opt.) | Attach pre-generated World Labs port world link (or call World API if time permits) |
| Notify Trade Ops | Draft email with summary + workbook + spatial link → hold for human approval → send |
| Wait / Branch | On Trade Ops approval signal (reply or task completion) → proceed to outreach |
| Outreach | Draft provider pre-registration emails → human approval → send; track replies |
| Cost Forecast | Process with AI / script → cost range with assumptions |
| Notify Finance & Compliance | Draft separate or combined messages → human approval → send |
| Close | Update Digital Employee memory, log run, archive email thread |

## 8. 24-HOUR BUILD CHECKLIST (CORE AGENT FIRST)

Priority is a working Evolus core (monitor → risk → workbook → Trade Ops notification) inside 24 hours. Spatial features are layered on top in order of ease.

1. Hour 0–2: Evolus workspace on Growth plan or higher. Connect Gmail / Google Workspace. Create monitoring label(s).
2. Hour 2–4: Create specialised Route-Risk agent. Upload seed knowledge (port guides, SOPs, initial provider list). Set Gemma preference + fallbacks.
3. Hour 4–6: Create Digital Employee seat. Paste exact system prompt from Section 5. Connect mailbox.
4. Hour 6–8: Build two-tab workbook (Google Sheet or Excel) with seed highly-qualified providers. Store in agent library / DE desk.
5. Hour 8–12: Build main Automation on Evolus canvas (or describe to Evo and refine). Keep paused. Test extraction + risk call with 3–5 sample emails.
6. Hour 12–16: Configure distribution lists (Trade Ops, Finance, Compliance). Define risk threshold. Run shadow tests.
7. Hour 16–20: Obtain Trade Ops sign-off on notification language. Activate Automation for live monitoring.
8. Hour 20–24: First live runs + rapid prompt refinement. Parallel: execute easiest World Labs items (see Section 10).

## 9. GOVERNANCE & COMPLIANCE NOTES

- Evolus keeps customer data in the EU and does not train models on customer data.
- All outbound communications carry the platform’s AI transparency notice and require human approval.
- Full activity log (automation runs, tasks, approvals) is retained for audit.
- Cost forecasts must be labelled as estimates; actual quotes remain the source of truth for Finance.
- Cold-chain and regulatory statements must stay within verified knowledge-base content; do not invent requirements.
- World Labs spatial assets must be labelled “AI-generated spatial approximation — verify with provider / port authority.”
- Access to the Digital Employee and agent should be limited to Logistics / Trade Ops / designated Finance & Compliance users.

## 10. SPATIAL INTELLIGENCE EXTENSION — WORLD LABS

World Labs (worldlabs.ai) provides spatial intelligence via Marble (generate persistent navigable 3D worlds from text, images, video, or layouts) and the World API. Atlas adds advanced reconstruction and simulation. These capabilities add visual decision support and facility-level insight on top of the Evolus agent. They are not required for the core email-to-workbook loop.

### World Labs Implementations — Ordered Easiest → Hardest (24-Hour Focus)

Execute in this order. Items 1–2 are achievable inside the remaining hours of a 24-hour build and deliver immediate value. Items 3–5 can start in parallel or follow immediately after.

#### 1. EASIEST — Pre-generate & cache static port worlds (manual, ~1–2 hours)

Create 2–3 high-quality Marble worlds today for the two primary alternatives. No API integration required.

- Go to marble.worldlabs.ai (or World Labs platform). Generate worlds from text + any public photos of Jeddah Islamic Port terminal / reefer areas and Port of Salalah / free-zone cold-storage zones.
- Prompt examples: “Container terminal and reefer yard at Jeddah Islamic Port with bonded warehouses and truck exits” / “Port of Salalah container terminal and temperature-controlled storage facilities”.
- Export or copy share links. Store the links in the agent knowledge base and in the workbook Spatial Preview column for Preferred providers.
- Digital Employee procedure already supports attaching these links when risk ≥ Medium. Zero code change needed beyond pasting links.

**Owner:** Any team member with World Labs access. **Output:** 2–3 shareable 3D links ready for Trade Ops notifications.

#### 2. EASY — Attach cached spatial links in Trade Ops notification (configuration only, ~30–60 min)

Once the links from step 1 exist, update the Digital Employee memory / simple-memory file and the workbook seed so the agent automatically includes the correct port world when it recommends Jeddah or Salalah.

- Add a short lookup rule: “If recommended port = Jeddah → attach [link]; if Salalah → attach [link]”.
- Test one end-to-end notification with a sample high-risk email. Confirm the spatial link appears and is labelled as AI-generated approximation.

**Owner:** Person configuring the Digital Employee. **Output:** Live notifications now carry a 3D briefing.

#### 3. MEDIUM — Enrich workbook with Spatial Preview column for top providers (~2–3 hours)

For the 3–5 highest-priority providers already in the seed workbook, generate small Marble worlds of their published facilities (cold store, yard, office) if photos exist, or of the general port zone they serve.

- Add the links to the Spatial Preview column.
- When the agent recommends those providers for pre-registration, Trade Ops receives both the provider row and a visual of the facility.

**Owner:** Logistics analyst + one person on Marble. **Output:** Richer shortlist that differentiates beyond Google reviews.

#### 4. MEDIUM–HARD — On-demand World API call inside Evolus automation (half-day to 1 day)

After the core agent is live, add an optional automation block that calls the World API when risk is High/Critical and no cached world exists for the recommended port.

- Requires World Labs API credentials and an Evolus “Call an endpoint” (or custom connector) block.
- Design as asynchronous: start generation, continue with text notification, later update with the world link if generation finishes in time; otherwise fall back to cached world.
- Keep this behind a feature flag so it does not slow the critical path on day 1.

**Owner:** IT / automation specialist. **Output:** Dynamic spatial briefings without manual pre-generation.

#### 5. HARDER — Facility dwell-time / cold-chain spatial heuristics feeding cost forecast (1–2 days follow-on)

Use Atlas-style reconstruction or richer Marble worlds to estimate relative distances (berth → cold store → inspection → gate) and feed simple dwell-time multipliers into the cost-forecast step.

- Requires more detailed imagery or layout data and careful calibration against real historical dwell times.
- Treat outputs as directional only; still label as estimates.

**Owner:** Logistics + data person after core + basic spatial are stable. **Output:** More grounded Finance notifications.

### 24-Hour Spatial Target

Inside the next 24 hours the realistic and high-value goal is: complete items 1 and 2 (pre-generate Jeddah + Salalah port worlds and wire the links into the Digital Employee / workbook). Item 3 can start in parallel if capacity exists. Items 4–5 are explicitly post-24-hour enhancements.

### Integration Guardrails

- Spatial assets are decision-support visualisations only — never authoritative survey or legal data.
- Always label: “AI-generated spatial approximation — verify with provider / port authority.”
- Do not block the core Trade Ops notification if World Labs is slow or unavailable.
- Cache aggressively; prefer pre-generated worlds for the first production week.
